

KimberLite
Token

Diamonds Are Eternal
Introducing
KimberLite Token

KimberLite Token is the world's first cryptocurrency backed by precious commodity assets in the form of Gemstones and AU Metals.

Abstract

Our team of banking and investment specialists have spent more than 3-years developing a cutting-edge ecosystem capable of withstanding any potential volatility. KimberLite Token (KIMBER) is the world's first cryptocurrency backed by precious commodity assets in the form of Gemstones and AU Metals.

The core use of KimberLite shall be undertaking peer-to-peer payments necessary within multi-million dollar precious commodity transactions. The instantaneous nature of Blockchain technology will allow vendors to validate receipt of buyer funds enabling completion of complex trades in real-time.

We shall utilise predictive methodology pertaining to sales being conducted for establishing stringent 'supply and demand' models for token usage. These forecasts create the opportunity for managing token release according to business requirements, eradicating instability commonly seen throughout the crypto industry.

Investor confidence shall be boosted via our vesting and lock periods as well as an annual program for 'burning' tokens. The main focus at all design stages has been a genuine desire for controlling circulating tokens and life-cycle which will result in a constantly buoyant market value.

The cornerstone of successful economies globally is based upon incentivisation, whether that be banks offering interest rates or sellers providing discounts. The KimberLite ecosystem shall be no different, rewarding user participation with a range of innovative schemes. These include investors being granted access to diamonds at drastically reduced prices.

Clearly, it is impossible for us to ignore metaverse integration and therefore we shall construct an online depository supplying diamonds alongside AU bullion in Non-Fungible Token (NFT) format.

These shall be purchased using KimberLite and freely interchangeable with real world physical assets. Whilst long-term expansion encompasses creating a 'Kimber Alt Stable Coin' fully backed by Gold and Diamonds reserves.

We are extremely confident that the exceptional foresight as well as in-depth planning behind KimberLite shall generate a robust crypto ecosystem, guaranteeing our investors unprecedented returns.

Introduction

Diamonds, the solid form of Carbon, are renowned for being the hardest material on Earth. They have long been recognised for their beauty as a gemstone, used in various jewellery items for centuries.

In terms of quantity, about 30% of diamonds discovered are considered 'gem quality' and distributed to experts for cutting, polishing then finally jewellery manufacturing. The remaining 70% produced are sold for industrial applications, including; cutting, drilling, grinding and polishing.

We are all familiar with the tradition of giving your future wife a 'diamond engagement' ring, yet few know the history behind this ritual.

In 1477, Archduke Maximilian of Austria commissioned the first diamond engagement ring on record for his betrothed, Mary of Burgundy. In doing so he sparked a trend for diamond rings amongst European aristocracy and nobility.

However, De Beers, the British company who mined gemstones in South Africa, are famed for making diamond engagement rings the common item they are today. It was their 1947 advertising campaign which was supported by Hollywood stars and their slogan recognised globally; "Diamonds are forever" that caused the tradition to sky-rocket in popularity.

Mined diamonds are mostly sold via the major international diamond centres:

- ✓ Antwerp
- ✓ Dubai
- ✓ New York
- ✓ Hong Kong
- ✓ Mumbai
- ✓ Tel-Aviv

There is no universal market price per carat for rough diamonds. Nevertheless, diamond prices have increased more than tenfold since 1960 to current market values..

Diamond Imports by Dollars 2019

Diamonds increase drastically in value through processing from production to retail. For example, in 2019 rough stone sales amounted to \$13.9 billion worldwide. However, after cutting and polishing, their value then increased by nearly double to \$26.7 billion. While the global diamond jewellery market for this same period recorded revenue of circa \$79 billion.

Nearly half (48%) of polished diamonds in 2019 were sold within the United States, whilst China ranked second.

There has been a sharp increase in Chinese market share over recent years based on their adaptation of a traditionally western custom; for giving a diamond engagement ring.

The impact of COVID-19 clearly cannot be ignored, during 2020 there was a decline in mine production compared to 2019. Whereby, output fell from 138.3 million carats in 2019 to 107.1 million in 2020 (a 22% reduction) with a rough stone sales value of \$9.2 billion.

However, 2021 saw significant signs of improvement with production increases expected in Botswana (+37%), Canada (+16.6%) and Angola (+26.3%) this shall result in growth of 1.4%. The long-term outlook continues to be bright with a predicted compound annual growth rate of 2.5% which will see production volumes reach 124.8 million carats by 2025.

Story Behind a Name

The Eureka Diamond was found near Hopetown, South Africa, on the Orange River by a young 15 year old boy named Erasmus Stephanus Jacobs in 1867. It was the first diamond discovered in South Africa and sparked what is known as the 'Kimberley Diamond Rush'.

Kimberlite is an igneous rock, which sometimes contains diamonds it is named after the town Kimberley where Erasmus made his remarkable discovery.

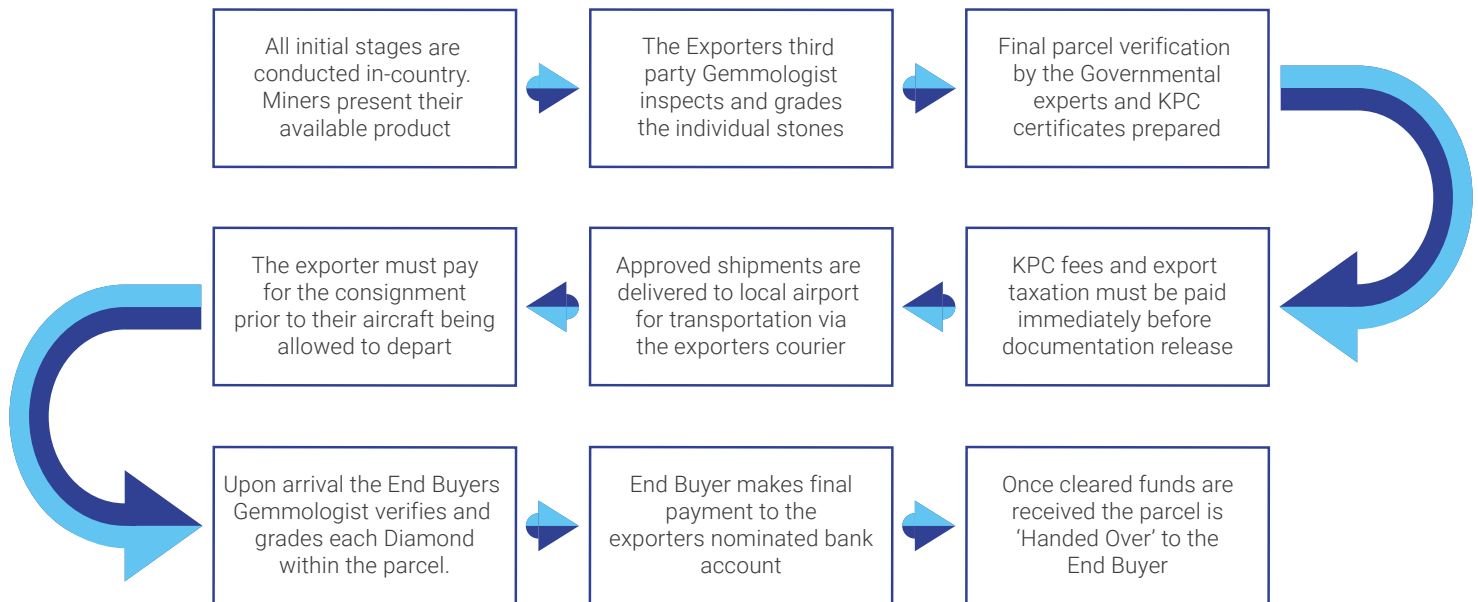

Kimberlite occurs in the Earth's crust in vertical structures known as kimberlite pipes, as well as igneous dykes but can also occur in horizontal sills.

These Kimberlite pipes are extremely rare and are the most important source of rough diamonds mined today.

The Problem

We a British organisation who have been actively involved in the wholesale diamond sector for more than 30 years, specialising particularly in importing and exporting rough gemstones. The transactional process required for completing deals has two inherent problems.

In order for those with less experience to appreciate these issues, it is essential to first understand the work-flow step-by-step:

The implementation of the Kimberley Process Certification Scheme (KPC) by the United Nations in 2003 eliminated so called 'blood diamonds' from the international market place. However, it not only ensured that any stones being sold were conflict free but at the same time legitimised sales of rough stones.

Long gone are those days where consignments could be purchased with suitcases of cash and simply transported out of the source country. The entire export process is now monitored at a Governmental level with official fees as well as taxation being paid prior to final export.

Diamond Price Point

The rough diamond value is a convoluted subject, whilst in general the price is stated as a cost per Carat (ct) typically factors behind an individual stone valuation can include (but may not be limited to); Colour, Clarity, Shape and Florescence. Such an array of variables makes calculating consignment sale prices extremely complex.

It is for this reason that both miners as well as the wholesale industry, tend to transact shipments based on an 'average price per carat'. With specific parcels categorised into groups depending on their overall quality.

High-end 'Gem Grade' stones usually have an average price per carat of circa \$2,800 to \$3,100 when sold in one of the worlds diamond trading centres such as New York or Antwerp. Whilst lower quality product for use within the general jewellery manufacturing sector will fetch \$1,000 up to \$1,750 and industrial grade stones at approximately \$100 as an average.

Problem One: Payment of KPC Fees and Taxation

Local Government Gemmologists, working in the KPC department, verify each stone contained within consignments prior to export, creating a detailed manifest as well as permits and Kimberley Process certificates.

Once their inspection has been completed exporters are required to pay both KPC fees and export taxes which are typical 5-8% (depending on the source country) of 'assessed' parcel value. These costs must be paid before any documentation is issued.

There are then two problems at this stage. Firstly, the so called 'assessed' value of the consignment is defined during inspection by the Government experts, it is not known in advance. Therefore, exporters are unable to prepare funds in-country beforehand.

Secondly, there is a trust issue, if exporters were to deposit additional cash locally ready for paying these fees then there is no guarantee banks will be able to return any excess.

Thus a delay occurs in completing the export operation whilst funds are being transferred bank to bank for making payment locally.

Problem Two: Making Miner Payments

Diamond exploration is undertaken at numerous locations globally, yet the vast majority of natural rough stones are mined in what can only be classified as less developed countries.

Concession owners struggle in gaining access to international bank accounts outside of their jurisdiction and are forced to cooperate with smaller local banks. However, they generally offer limited service levels and often their 'intermediary' connections throughout global banking networks can be unwieldy.

Exporters are required to transfer funds, commonly in the multi-million-dollar bracket, for paying miners. Complications surrounding 'international payments' necessitates banks conducting much deeper due diligence for completing extra regulatory steps.

Naturally, miners require final payment prior to consignments being exported, whilst buyers on the other hand are intent on ensuring consignments are securely loaded on board their aircraft before depositing any funds.

Therefore, the window for transferring payment is extremely time sensitive, with mere minutes available to satisfy both parties needs rather than days often taken by banks.

Problem Three: End Buyer Completion

Upon completion of final end-buyer inspection by their Gemmologist payment must be made in full for the consignment being purchased. With parcel sizes ranging from 10,000 to 50,000 carats this equates to a financial transaction between \$28 million and \$150 million.

Utilising conventional banking infrastructure is extremely complex and cumbersome when transferring funds of this size. Not only are there regulatory and due diligence processes that must be completed but physical wire transmission and clearance into the beneficiary account can take anywhere from 1 to 3 banking days. This operation will be even further complicated when dealing with international transfers.

There are of course several ways of reducing time taken for undertaking banking operations, such as; ledger-to-ledger movement of funds within the same bank or placing cash into attorney escrow prior to commencing Gemmology inspection.

However, the diamond industry is notoriously secretive with both wholesale buyers and sellers constantly seeking methods for making deals less visible. Therefore, in reality using those solutions mentioned will not only be costly but undoubtedly increase a transactions profile.

Unfortunately, end-buyers are not typically either banking or financial professionals, albeit there are a few exceptions to this rule. They do not comprehend waiting days while funds are transferred, instead they want to simply complete their Gemmology inspection and then take immediate delivery of the shipment.

Why not use an existing Crypto Currency?

We all know that there is a seemingly endless plethora of Crypto Currencies already in circulation, which are either aimed at investors or 'Metaverse' participation.

The cost of exchanging between different currencies or tokens can be costly, especially when trading between Blockchains. Those exchange fees become significant when undertaking a sales transaction of up to \$150 million.

When negotiating sales and purchase agreements pertaining to physical trades it is exceptionally difficult for any contracting party accept these costs.

Similarly, if different miners are each using their own preferred Crypto Currency it will be impossible for wholesalers to hold various forms of token with sufficient capacity for enabling large payments. They would have to hold a single Crypto then accept exchange fees for when concluding individual deals.

What is clearly missing from the current Crypto ecosystem is a token designed and developed purely for conducting exceptionally lucrative 'precious commodity' trades. A token which seamlessly synchronises payments between all parties; wholesaler, end-buyer and producer.

The Solution

Our mission in launching the KimberLite Token (KIMBER) is to deliver a standard crypto currency which can be utilised throughout the precious commodity sector for conducting peer-to-peer payments.

The KIMBER Token shall be based upon existing Blockchain infrastructure and industry standards thus eliminating any complex technical issues whilst reducing our 'time to market'.

KIMBER shall operate on the Binance Smart Chain (BSC) network utilising BEP20 protocols offering users and investors the most stable of working environments as well as cost effective transfers.

Those core problems identified within commodity trades of timing issues whilst depositing funds utilising conventional banking systems shall be totally eliminated via a peer-to-peer solution offered through state-of-the-art Blockchain technology.

Instantaneous confirmation of remittances shall allow transactions to be completed in real time, thus eradicating delays during both export and sales processes.

While decentralisation coupled with 'access for all' crypto principles will allow miners located in even the remotest regions to participate in our platform.

There are countless small to medium sized miners unable to penetrate international markets merely as a result of poor banking capabilities in their local communities.

KIMBER will open up the possibility for conducting sales globally for a vast range of new producers eager to take advantage of our services.

In addition to reducing completion time for transactions and establishing ease of access throughout the industry, there are also obvious cost advantages that KIMBER presents our users.

The extortionate fees charged by banks for multi-million-dollar wire transfers shall be removed from the equation, with only network fees being applicable to transmission via the Blockchain.

There are also clearer lines of responsibility with senders being the party who pays those fees, easing execution of sales and purchase agreements between wholesaler, miner and end-buyers alike.

The key attractions for diamond traders around the world are undeniable, our KIMBER platform simplifies sales and purchase transactions, reduces costs as well as bypassing time constraints. It shall be superior to any conventional banking system or rival in every conceivable way.

We have agreements in place with several wholesale buyers of rough gemstones as well as a number of producers desirous to take advantage of the amazing benefits KIMBER offers. These initial partners create the scope for transacting circa 40,000 (forty thousand) carats monthly. This shall generate \$114 million per month of payments being made using KIMBER tokens.

The first transactions conducted with KIMBER as their currency of preference are due to commence in Q2 2022. Once successful launch has been achieved our marketing team shall begin adding new product suppliers to the ecosystem monthly.

Our conservative target is 100,000 carats of trades through KIMBER per month by Q4 2022. We feel confident, based on initial responses received throughout the industry, that this is an extremely realistic objective, that may well easily be surpassed.

Therefore, based on trading 100,000 carats we shall be implementing approximately \$285 million per month and \$3.42 billion annually in diamond deals through the KIMBER platform within 12 months.

Future Development

Incorporation of Other Commodities

The vast majority of commodity transactions undertaken annually encounter those same completion difficulties associated to 'time sensitivity' issues surrounding transferring funds and high banking fees charged. Our KIMBER token will, therefore, lend itself to a diverse range of applications within the market sector.

However, one product that stands out as having an obvious use case for KIMBER is raw AU Metal, whose basic sales and purchase procedure mirrors that of rough gemstones. There are identical key parties involved with producers, who have limited banking access, wholesalers and end-buyers.

The countries in which raw AU Metal is produced are very similar to those exploration locations of rough diamonds. Indeed, a number of the miners who have already agreed to utilise KIMBER tokens within their gemstone deals also produce AU Metal from their sites. This will streamline introducing KIMBER into the AU arena.

There are between 2,500 and 3,000 tons of raw AU Metal mined annually with an average selling price of circa \$34,000 per kilogram. This results in global trade volume of circa \$7.09 billion monthly or \$85 billion per year.

KIMBER Wallet Development

When launching KIMBER, like any other BEP-20 compliant token, it will naturally be compatible with those existing wallets in operation.

However, as we expand our network of wholesalers, end-buyers and producers who utilise KIMBER there is potential for encountering users less familiar with Blockchain technology.

Therefore, our long-term volume expansion strategy can be enhanced through development of a wallet designed specifically for KIMBER which will meet our clients and users requirements.

A simplified interface will cater for ease of token transfer while being dedicated to exclusively for use with our KIMBER platform eliminates needing to add coin data during wallet configuration, which can be both complicated and confusing for inexperienced users.

Metaverse Integration

The re-branding announcement by Mark Zuckerberg that Facebook will be known as 'Meta' along with a staggering \$10 billion of infrastructure investment planned, has spotlighted the whole Metaverse project. It has changed the common perception of people world-wide propelling what many see as the future into mainstream news.

While our KIMBER token is primarily aimed at conducting financial transactions within commodity trades, it is impossible to ignore potential for integration in the Metaverse space.

We are witnessing a growing trend in those wishing to acquire high value assets in the Metaverse with Real Estate and Luxury Items such as yachts in Non-Fungible Tokens (NFT's) form being purchased for millions of dollars.

As utilisation and acceptance of Metaverse applications increase so will the desire of people eager to obtain NFT status symbols.

We plan to establish a Metaverse depository that allows investors to exchange their KIMBER tokens for both Diamonds and Gold created as NFT's.

These virtual NFT holdings will be backed by equivalent assets in the physical world. Therefore, allowing owners to exchange assets between Metaverse and real world with a simple mouse button click.

Kimber Stable Token Creation

There are various so called 'stable coins' in circulation that claim to be tethered or backed by physical fiat currencies, albeit this has been disputed on several occasions. However, what is missing is a genuine stable token back by physical assets such as Gold or Diamonds, we plan to introduce a token which will fill this gap.

Operational profits shall be utilised for accumulating gold and diamonds which can be subsequently used as collateral behind a KIMBER 'Stable Token' offering investors a profit generating safe solution.

We will allow investors to freely exchange KIMBER held for our stable token, providing them with not only maximum security but increased profit potential.

While owners of physical gold or diamonds will be able to convert them into KIMBER Stable tokens, which shall provide them with an untraceable crypto asset.

Tokenomics

Token allocation and metrics are the foundation of any prosperous Crypto ecosystem, their significance is often overlooked by many. However, our team have spent a huge amount of time and effort throughout the development of KIMBER on defining tokenomics that create platform stability whilst eliminating price volatility.

The bed-rock of conventional economies worldwide is based up a principle of ‘incentivisation’ whether spending or saving the currency of choice users are presented with motivational stimulus. In our opinion any crypto ecosystem must also offer its community similar impetus for participation, thus establishing longevity alongside value advancement.

With growth assured volatility can be eradicated through balancing token supply with demand. This is where KIMBER is unique to any other crypto currently available.

The prime case use of KIMBER is purchasing precious commodities, the sales and purchase agreements for which are accessible to our team. Therefore, we are able to accurately calculate how many KIMBER tokens are required to complete planned transactions each month.

With such information in-hand token supply can be precisely aligned to demand, protecting investors against unpredictable price fluctuations and generating guaranteed profits.

Executive Summary

Token Symbol	KIMBER
Tokens Minted	200,000,000
Token Generation Event (TGE)	February 8 th 2022
ICO Sale Start Date	February 9 th 2022
ICO End Date	April 6 th 2022
IDO Public Sale Start	April 11 th 2022
Acceptable Currency	BTC, ETH, USDT, BNB, XRP, LTC, SOL
ICO Sale Duration	56 Days
Total ICO Tokens Sold	4,000,000 (2%)

Token Allocation

The KIMBER Token shall be a BEP20 asset supported by the Binance Smart Chain. There will be a total of 200,000,000 tokens minted, a supply that will never be increased as per smart contract definition. Thus, we are building an ecosystem which is based upon the deflationary model.

Purchasing KIMBER Tokens

During the ICO period we are able to accept various payment methods for purchasing KIMBER Tokens utilising several major cryptocurrencies, these include; Bitcoin (BTC), Ethereum (ETH), Tether (USDT), Binance (BNB), Ripple / XRP (XRP), Litecoin (LTC), Solana (SOL). If investors want to use another form of crypto they can contact us with their requirements.

We have provided links on our website for investors to obtain tokens. However, those wishing to acquire larger amounts can contact us directly to discuss individual needs.

For purchases of over \$50,000 we are willing to accept bank transfers and can manage sales via our US based Escrow attorney. We can also provide investors with a 'Sales and Purchase' agreement for buying their KimberLite.

Receiving KIMBER Tokens

Once we have received payment, the purchased number of KimberLite tokens shall then automatically be transferred to the wallet address provided.

Price Point

Careful consideration has been given to Price Point, both during KIMBER launch (ICO) phase as well as our first public offering (IDO). The price point objectives defined below are two fold;

Firstly, we were eager to afford early stage investors an opportunity for rapid returns. With this in mind there is up to 110% uplift between the two offer prices, allowing for profit realisation in as little as 90-days.

Secondly, we must keep sight of the KIMBER core use case, namely; transacting precious commodities. In order to undertake those deals, the value of tokens in circulation should be sufficient for completing all transactions planned in a given month.

This target must be realised through growth in value rather than flooding the market with KIMBER tokens. Therefore, we have selected entry price points designed to achieve a market value capable of undertaking the initial sales and purchase contracts within 90 days of launch.

ICO Offering

The ICO price offering shall be \$0.10 providing early investors with up to 110% profits in 90-days when compared to our IDO listing.

Public (IDO) Offering

The IDO sale round will be based on a varying price ranging from \$0.15 - \$0.21, with \$0.02 incremental increases being based on the number of tokens sold. However, based on our calculations (below) still presents an outstanding opportunity with huge upside potential.

Vesting and Lock

Our main aspiration when electing to include an ICO phase as part of the KIMBER launch program, was attaining market confidence in the extremely robust ecosystem architecture that we have developed.

It is our belief that a core element in building investor assurance levels can only be achieved via creating 'vesting' and 'lock' periods for certain portions of minted tokens.

Both 'Lock' period and percentage released at each interval have been calculated to guarantee that a maximum of 2% of total minted tokens (4,000,000 tokens) are released per month throughout the first 12 months, this shall eliminate any early price fluctuations and build price momentum.

The Lock and Vesting durations are both based on the Token Generation Event (TGE) which is scheduled for 8th February 2022.

	Percentage	Supply	Token Price	Total Raise (USD)	Lock (Months)	Vesting (Months)	Notes
ICO Stage	2%	4,000,000	\$0.10	400,000	1	0	Tokens will be locked for 1 month from TGE to avoid price instability during to the IDO release
IDO Stage	8%	16,000,000	\$0.15 - \$0.21	2,400,000	0	0	The release of IDO round tokens shall be managed to deliver 25% per week for 4 weeks
Marketing	8%	16,000,000			2	3	25% unlocked 6 months after TGE and then 25% monthly there after
Team	20%	40,000,000			6	18	10% unlocked 10 months after TGE and then 5% monthly there after
Incentivisation	20%	40,000,000			6	18	10% unlocked 11 months after TGE and then 5% monthly there after
Advisors & Partners	17%	34,000,000			12	8	20% unlocked 12 months after TGE and then 5% monthly there after
Company	25%	50,000,000			18	18	10% unlocked 24 months after TGE and then 10% monthly there after
	100%	200,000,000		2,800,000			
	Soft Cap at TGE (USD)		100,000				
	Hard Cap at TGE (USD)		400,000				

Distribution and Release of Tokens

The most important point within any crypto ecosystem is attaining stability while avoiding asset value volatility. Our calculations pertaining to the number of tokens to be minted as well as projected future worth are all based upon rapid growth and market valuations for KIMBER far in excess of the initial price offerings.

We shall achieve our growth target as well as stability through closely regulating how many tokens are in circulation during all stages of deployment, creating a strong 'Supply and Demand' atmosphere which shall benefit the community as a whole.

The primary use case for KIMBER is purchasing precious commodity consignments. These transactions shall all be subject to sales and purchase agreements executed between the parties. This then allows us to establish accurate models for the number of tokens required to complete those deals on a monthly basis.

Total value of commodities to be purchased using KIMBER per month as well as the current token market price token are known parameters. Therefore, we are able to align token releases with demand levels in order to accomplish price growth.

This ability positions us uniquely amongst the crypto Assets currently available for investment and shall enable us to maximise both the evolution of KIMBER and returns for our investors.

However, for additional investor protection we have established a hard rule of never releasing more than 2% of minted tokens per month during the first 12 months of the project.

Token Life-Cycle

Following conclusion of commodity trades conducted using KIMBER, those tokens utilised for purchase will reside with the producers, having passed from buyer to seller. Producers naturally need Fiat currency for continuing mining operations, acquiring goods and services or for paying employee salaries.

If producers are simply permitted to exchange their KIMBER for physical currency this may generate unpredictability in token prices. Therefore, we have designed mechanisms for controlling token life-cycle and eliminating any prospect of producers randomly selling off tokens.

Producer Buy-Back

We will connect product producers with new wholesalers and end-buyers wishing to enter the KIMBER Platform.

Those buyers will purchase tokens from producers at current market value, which they shall then subsequently utilise in future transactions for acquiring commodity shipments available within the ecosystem.

Equipment and Service Procurement

The vast majority of small to medium sized mine operators are commonly supporting entire communities as well as their exploration operations through selling product.

Utilising profits realised for purchasing a wide range of equipment, machinery, food, medical supplies, clothing and other services. However, they often face procurement challenges either as a result of weak international connections or suppliers determined to over charge them for often outdated merchandise.

We shall assist our miners to use their KIMBER Token for obtaining the goods and services they need from reliable supplier networks. The tokens spent shall then be recycled and sold back to the wholesalers and end-buyers for purchasing future product consignments.

This supply-chain shall be managed internally offered as a service to incentivise producers when joining our KIMBER platform. We shall charge a nominal service fee which in-turn can be used for financing investor returns.

Burn Strategy

We shall support long-term stability and value growth via our dedicated 'Buy-Back and Burn' strategy. A percentage of the profits generated from provision of equipment and services to miners as well as the sale of NFT's shall be allocated to repurchasing KIMBER tokens.

Our plan is that buy-back and burn shall be an annual event, whereby 20% of the overall operating profits are employed for obtaining KIMBER Tokens from the secondary market. This process shall continue until 50% of tokens originally minted have been repurchased and burnt.

Incentivising the Community

Wholesaler, End-Buyers and Producers Incentives

Within our allocation plan we have reserved 20% of minted tokens to be employed for 'Incentivisation'. These shall be used to attract new wholesalers, end-buyers and producers to participate in the KIMBER platform.

For wholesalers and end-buyers we will offer them a 5% 'bonus' based on the total value of KIMBER they initially purchase, paid to them in tokens.

Whereas, producers shall be rewarded when selling their first consignment via receiving 5% additional payment, which shall also be paid from the incentivisation pool in tokens.

Investor Incentives

Product Acquisition

We know that many institutional investors as well as hedge fund managers purchase physical assets, such as; Diamonds and AU Metals as part of their overall portfolio of holdings. These are precisely the type of stakeholders our KIMBER platform is looking to attract as partners.

Therefore, we will offer long-term participants, holding more than 200,000 tokens, opportunities to purchase product from our supplier network at dramatically reduced prices well below market value at the time of the acquisition.

Dividend Payment

We shall reserve 7.5% of total annual operating profits for paying investors dividends. Any wallet address that contains more than 500,000 tokens shall receive a percentage share of the overall dividend pool based on the number of tokens held.

Future Value Calculations

Short Term Token Price Predictions

When designing the KIMBER Token a great deal of emphasis has been placed on stability as well as mechanisms for establishing value growth. This includes a detailed 'roll-out' plan for deployment and use expansion.

Releasing tokens into the ecosystem shall be strictly controlled and constantly monitored to ensure that not only are our growth objectives realised but also that there are sufficient available for completing the contemplated physical transactions.

Through analysing our 'roll-out' plan we can predict KIMBER Token price within the first 12 months of its life-cycle, based upon value of commodity transactions being undertaken.

We must have sufficient tokens in circulation for completing all physical trades planned in any one given month, this 'supply and demand' model shall then drive KIMBER market value.

Assumptions

- ✓ We have agreements in place for transacting 40,000 carats per month, including a 'ramp-up' strategy with KIMBER to be used as the payment method.
- ✓ We have undertakings from other producers to commence receiving payments using KIMBER throughout the first 12 months of launching the platform, allowing systematic expansion.
- ✓ We have based the 'average sales price per carat' used in calculating predictions on an extremely conservative \$2,500 per carat forming high-levels of contingency within our financial models.

Note: The initial contracts for the first 40,000 carats to be transacted using KIMBER are based upon an average price per carat of \$2,850.

- ✓ We have excluded any 'lost' tokens (or any other form of leakage) as a result of users or investors inability to access their wallets.
- ✓ We have excluded any tokens retained by investors and assumed that tokens already released are available for conducting transactions within the ecosystem.

Period	Volume Increase (Carats)	Total Period Volume (Carats)	Transactional Value	Percentage of Tokens Released	Number of Tokens in Circulation	Token Value
Month 1	-	-	-	2%	4,000,000	\$0.10
Month 2	-	-	-	8%	20,000,000	\$0.15
Month 3	5,000	5,000	\$12,500,000	2%	24,000,000	\$0.52
Month 4	5,000	10,000	\$25,000,000	2%	28,000,000	\$0.89
Month 5	10,000	20,000	\$50,000,000	2%	32,000,000	\$1.56
Month 6	10,000	30,000	\$75,000,000	2%	36,000,000	\$2.08
Month 7	10,000	40,000	\$100,000,000	2%	40,000,000	\$2.50
Month 8	15,000	55,000	\$137,500,000	2%	44,000,000	\$3.13
Month 9	15,000	70,000	\$175,000,000	2%	48,000,000	\$3.65
Month 10	15,000	85,000	\$212,500,000	2%	52,000,000	\$4.09
Month 11	15,000	100,000	\$250,000,000	2%	56,000,000	\$4.46
Month 12	-	100,000	\$250,000,000	-5%	53,200,000	\$4.70

Notes:

1. In accordance with our overall model, Month12 will be a 'Burn' period whereby we anticipate approximately a 5% reduction in the circulating token pool.
2. If there is any unforeseen or unpredictable delay in the 'roll-out' plan stated then we shall suspend the release of tokens in order to avoid price volatility.
3. Based on the above calculations an initial investment purchasing tokens at an ICO cost of \$0.10 will yield a return of 47x within 12 months, which is well above crypto industry standards.

Market Variables

Whilst we are extremely confident in both our ‘roll-out’ plan as well as the short-term price predictions stated above there are market variables that may negatively or positively impact KIMBER value. Foresight and recognition of these whilst planning for launch shall enable us to avoid dramatic fluctuations and maintain a buoyant token value.

We have, therefore, considered a several key variables along with how they may alter short-term pricing;

Investor Retention – Investors in any arena ‘hoard’ assets either as collateral or in order to realise gains over a period of time. Those participating within cryptocurrency markets are no different.

We have considered two scenarios for investors retaining KIMBER based on a percentage of total number of tokens in circulation per month.

Reduction in Volume – We have agreements in place pertaining for the first 40,000 carats of gemstones to be transacted using our KIMBER platform. There are also sufficient interested producers wishing to utilise the exceptional payment mechanisms on offer to achieve our year one target of 100,000 carats per month.

However, we cannot discount unforeseen circumstances or force majeure conditions that may constrain monthly volume capacity.

Period	Volume Increase (Carats)	Total Period Volume (Carats)	Transactional Value	Percentage of Tokens Released	Number of Tokens in Circulation	10% Investor Retention	15% Investor Retention	10% Reduction in Volume	25% Reduction in Volume
Month 1	0	0	-	2	4,000,000	\$0.10	\$0.10	\$0.10	\$0.10
Month 2	0	0	-	8	20,000,000	\$0.15	\$0.15	\$0.15	\$0.15
Month 3	5,000	5,000	\$12,500,000	2	24,000,000	\$0.58	\$0.61	\$0.47	\$0.39
Month 4	5,000	10,000	\$25,000,000	2	28,000,000	\$0.99	\$1.05	\$0.80	\$0.67
Month 5	10,000	20,000	\$50,000,000	2	32,000,000	\$1.74	\$1.84	\$1.41	\$1.17
Month 6	10,000	30,000	\$75,000,000	2	36,000,000	\$2.31	\$2.45	\$1.88	\$1.56
Month 7	10,000	40,000	\$100,000,000	2	40,000,000	\$2.78	\$2.94	\$2.25	\$1.88
Month 8	15,000	55,000	\$137,500,000	2	44,000,000	\$3.47	\$3.68	\$2.81	\$2.34
Month 9	15,000	70,000	\$175,000,000	2	48,000,000	\$4.05	\$4.29	\$3.28	\$2.73
Month 10	15,000	85,000	\$212,500,000	2	52,000,000	\$4.54	\$4.81	\$3.68	\$3.06
Month 11	15,000	100,000	\$250,000,000	2	56,000,000	\$4.96	\$5.25	\$4.02	\$3.35
Month 12	0	100,000	\$250,000,000	-5	53,200,000	\$5.22	\$5.53	\$4.23	\$3.52

Medium to Long Term Token Valuations

The principle use case for the KimberToken is completing precious commodity deals, initially focussing on the diamond sector with plans in place to expand into AU Metal sales.

We know the annual volumes as well as market worth of each target commodity and hence can calculate the required value our KIMBER token must attain in order to conduct these transactions.

We must have sufficient tokens in circulation for completing all physical trades planned in any one given month, this 'supply and demand' model shall then drive KIMBER market value.

Our calculations below are based on a number of assumptions and exclusions;

Exclusions

- ✓ 'Lost' tokens (or any other form of leakage) as a result of users or investors inability to access their wallets have been excluded.
- ✓ We have excluded tokens retained by investors and assumed all minted tokens are available for conducting transactions within the ecosystem.

Assumptions

- ✓ Our 'Burn' strategy is designed for buying-back 50% of original minted tokens, which results in a maximum circulation of 100,000 token after burn.
- ✓ KIMBER roll-out plan is based on 36 months, therefore, full utilisation within the industry will not be realised until 2025. With this date in mind we have incorporated a pessimistic annual diamond production volume for this period, being 124,600,000 carats.
- ✓ In order to reach targeted diamond volumes we shall need to transact stones of all grades, which includes industrial diamonds as well as 'Gem Quality'. The average selling price per carat across the entire spectrum of grades in 2019 was \$100.51.
- ✓ Raw AU Metal production is calculated on yearly production of 2,500,000 Kg (2,500 Tons) at a sales value of \$34,000 per kilogram.
- ✓ We have assessed a range of likely outcomes based on achieving a 'Percentage Market Share' of the total monthly transaction value. Our objective is to realise a minimum 10% of trades utilising KIMBER payments.

Industry Market Share	Monthly Diamond Production (Carats)	Rough Diamond Transaction Value (Monthly)	Monthly Raw AU Production (Kg)	Raw AU Transaction Value (Monthly)	Total Commodities Transaction Value (Monthly)	Market Share Value Monthly (USD)	IDEX Tokens in Circulation (After Burn)	Predicted Token Value
100%	10,383,333	\$1,043,628,833	208,333	\$7,083,333,333	\$8,126,962,167	\$8,126,962,167	100,000,000	\$81.27
80%	10,383,333	\$1,043,628,833	208,333	\$7,083,333,333	\$8,126,962,167	\$6,501,569,733	100,000,000	\$65.02
60%	10,383,333	\$1,043,628,833	208,333	\$7,083,333,333	\$8,126,962,167	\$4,876,177,300	100,000,000	\$48.76
40%	10,383,333	\$1,043,628,833	208,333	\$7,083,333,333	\$8,126,962,167	\$3,250,784,867	100,000,000	\$32.51
20%	10,383,333	\$1,043,628,833	208,333	\$7,083,333,333	\$8,126,962,167	\$1,625,392,433	100,000,000	\$16.25
10%	10,383,333	\$1,043,628,833	208,333	\$7,083,333,333	\$8,126,962,167	\$812,696,217	100,000,000	\$8.13

Our Team

Our executive team retains a vast wealth of experience with a particular emphasis on banking, finance and investment. Their combined knowledge, alongside a truly exceptional international reputation for achieving success, is the driving force behind KIMBER and guarantees future project prosperity.

Ian Lavender
Chief Executive Officer

Mr. Lavender's first managerial posting came courtesy of BMW Group. He now boasts more than 25 years' experience in senior positions.

Ian previously worked in the technical sector both as a software development engineer and project manager.

His specialist knowledge coupled with a hands on approach has key in creating our world-class crypto ecosystem.

Mr. Hughes studied Commerce and Finance, graduating with a BCom from the University of British Columbia.

He has since excelled in the financial sphere having held high profile roles at a number of major institutions as well as Top 10 banks, successfully launching numerous IPO's globally.

He a proven commodity trading expert, managing all aspects of the sales cycle from negotiation phase to trade execution.

Paul Hughes
Commercial Director

Gabriel Popa
Business Development Director

Originating from Romania Mr. Popa earned his MBA in Economic Science and Banking at Aurel Vlaicu University in Arad.

He has subsequently worked within the banking, insurance and auditing spheres, as well as consulting for numerous local and global organisations.

Principally he is involved in business development, expanding our producer networks and building the KIMBER family.

Joseph Jinn
Compliance Director

Mr. Jinn is a Korean born Canadian senior executive with a Law degree from University of Victoria and a BA in Economics from UCLA.

Joseph has amassed expertise in corporate finance, strategic transactions, legal compliance as well as business development.

His role and responsibilities within the KIMBER team include; legal regulations, contract oversight as well as investor relations.

Melanie Fisk
Executive Assistant

A proven expert in the field of office administration and all round business management.

Ms. Fisk is a dedicated professional whose poise and personality shine through when interfacing with key stakeholders.

She is extremely methodical with a meticulous attention to detail and capacity for forward thinking, constantly going “above and beyond” to satisfy investor requirements.

Where required our board of directors shall be complemented through a global network of advisors and technical experts, ensuring that project goals are realised at every stage. Success as well as motivation of external partners shall be achieved via them becoming KIMBER stakeholders.
